SUMMARY

Software Engineer with 5+ years at General Motors, progressing from Software Development Engineer in Test (SDET) to full-stack SWE. Brings hands-on experience building backend services, distributed systems, and internal platforms in Go (Golang) with PostgreSQL. Proven ability to deliver high-reliability, event-driven systems in complex enterprise environments — including a fleet-wide software tracking platform spanning millions of vehicles. Comfortable working across the stack, from REST API development to React-based tooling, with a background in test automation that brings a strong quality mindset to every codebase.

EXPERIENCE

Software Engineer | *General Motors*

2023 – Present

- Contributed to a full-stack internal platform reconciling expected vs. installed software across the GM vehicle fleet — a high-reliability system processing real-time state changes across millions of vehicles.
- Built backend services in Go with PostgreSQL within an event-driven microservices architecture, enabling scalable, decoupled communication across a distributed vehicle software ecosystem.
- Leveraged Temporal for durable workflow orchestration, increasing resilience of long-running reconciliation processes and reducing failure-related operational burden.
- Built React-based dashboards and internal tooling enabling engineers and stakeholders to monitor vehicle software compliance state across the full vehicle fleet.
- Integrated AI-assisted development practices into daily workflows, including LLM-powered code review, paired programming with AI tools, and agentic testing pipelines to analyze application outputs and surface regressions.
- Accelerated feature delivery and code quality by leveraging AI tooling for rapid iteration, documentation generation, and debugging complex distributed system behavior.
- Applied agentic testing workflows to automate output analysis and anomaly detection across the vehicle software platform, reducing time spent on manual result interpretation.

Software Development Engineer in Test (SDET) | *General Motors*

2021 – 2023

- Designed and built a comprehensive automated test suite for GM's customer account management system, significantly reducing manual QA effort and improving release confidence.
- Developed test automation frameworks validating critical customer-facing workflows and backend integrations across front-end and API layers.
- Partnered with software engineers and product teams cross-functionally to define test strategies, raise code quality, and establish CI/CD pipeline integration.

SKILLS

Languages & Frameworks: Go (Golang), JavaScript/TypeScript, React, SQL, Bash

Databases: PostgreSQL

Tools & Platforms: Temporal, Tilt, Git, Docker, CI/CD Pipelines

Architecture: Event-Driven Architecture, Microservices, REST APIs, Distributed Systems

Other: Test Automation, QA Engineering, REST API Development, Developer Tooling

EDUCATION

B.S. in Game Programming & Development | *Southern New Hampshire University* Dec 2019
